## S&G; Digital Lock Battery Guide

### S&G; Electronic Lock Series

The S&G; 6120, 6123, and 6125 represent modern electronic vault solutions. All models use standard 9V batteries with low-battery warning indicators.

### Battery Replacement Procedure

- **Access Battery Compartment:** Inside door bolt assembly, small access cover marked 'BATTERY'
- **Current Draw:** 6120 draws 150mA average, 6123 draws 200mA with WiFi, 6125 draws 175mA
- **Battery Life:** Typical 9V alkaline lasts 12-18 months depending on usage pattern
- **Installation:** Remove old battery, insert new battery positive terminal first, close cover firmly

### Low Battery Warnings

Green LED turns amber when battery voltage drops below 8.2V. If amber light appears, change battery within 48 hours to prevent lockout. All S&G; units have mechanical override key for emergency access.

### Lockout Recovery

If battery completely depletes, mechanical override key unlocks without power. For lost override keys, S&G; factory can provide replacement with factory authentication. Audit trail automatically logs all unlock events with timestamp.
